

# Sani-Saver

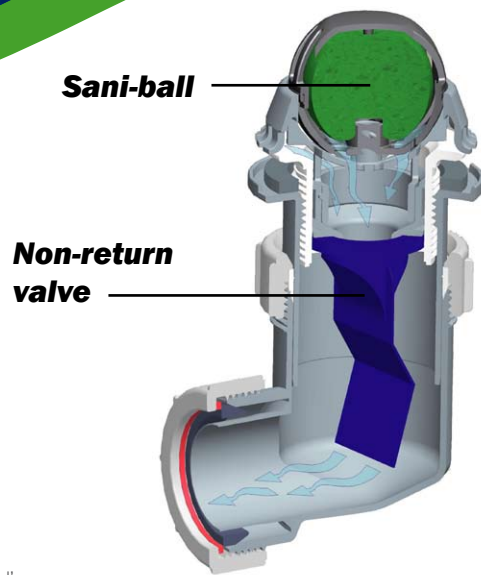

## How it works...

When urine passes through the cartridge, a patented mal-odour counteractant is released, tackling urine odour at its source.

As soon as the Sani-Ball liquid is empty, replace with a new one - on average usage a Sani-Ball will last around 1 month.

Friendly bacteria in the cartridge helps break down uric salts, and because there's no water flushing, there's no build up of lime-scale.

The specially designed non-return trap prevents back-odours and odours from 'below the bowl'.

Common Urinal Problems		Sani-Saver Solutions
<b>High Water Usage</b>	A urinal with a 9 litre cistern flushing every 15 minutes uses 315,000 litres of water per year, costing up to £700 and wasting huge amounts of water	'Sani-Saver' will save you 100% on urinal water consumption, thus eradicating the need for costly water management systems and the associated carbon usage.
<b>Unpleasant Odours</b>	Odours are created above and below the urinal bowl leading to bad smells that can create a negative user experience	The patented Malodour Counteractant in the cartridge chemically neutralises odours.
<b>Urinal Blockages &amp; Flooding</b>	Over time, uric acid, salts and scale build up to form a bio-film on the urinal waste trap, drain and pipework, providing an ideal environment for bad bacteria to grow. Additionally, cigarette butts, hairs, chewing gum and other debris can also cause blockages. By flushing water, there is always the potential for flooding.	The cartridge penetrates the uric salts, dissolving limescale and thus reducing the opportunity for flooding. This will ensure considerable savings in maintenance costs.
<b>Poor Hygiene</b>	Flushing water creates an ideal environment for the cultivation of bad bacteria which means that more aggressive cleaning solutions are needed. Many of these solutions may be hazardous and detrimental to the environment.	No flushing is required with Sani-Saver; and the non-return valve prevents bacterial odours in the pipework from entering the washroom.
<b>Damage</b>	Where one urinal or the tiling behind is cracked, it is often necessary to replace the entire washroom, as the removal of the urinal causes significant damage to the tiles.	The Sani-Saver kit allows quick, cost-effective replacement of a urinal wall, without major disruption.
